## GENERAL RESEARCH INTERESTS

My research is rooted in igneous petrology, and I am broadly interested in the physical and chemical processes that govern interior evolution, volcanic activity, and magmatic differentiation on Earth and other rocky planets. I focus particularly on 1) mantle melting, differentiation and volatile evolution in the context of large-scale mantle heterogeneity, 2) the growth habits of crystals and their response to magmatic dynamics, and 3) the mechanisms of metal enrichment in magmatic ore-forming systems.

To carry out my research, I integrate geochemical datasets, experimental petrology, field observations, thermodynamics, computational modelling, and geophysical constraints to quantitatively interrogate natural samples and experimental products in a multidisciplinary framework
